

Software Project Management

Assignment-0

TYPE OF QUESTION: MCQ/MSQ

Number of questions: 10

Total mark: 10 X 1 = 10

QUESTION 1:

Which one of the following is not a symptom of the present software crisis?

- a. Software is expensive.
- b. It takes too long to build a software product.
- c. Software is delivered late.
- d. Software products are required to perform very complex tasks.

Correct Answer: d. Software products are required to perform very complex tasks.

Detailed Solution:

Option d is not a symptom, but rather a cause or characteristic of modern software systems. The increasing complexity of tasks software is expected to perform has contributed to the software crisis, but it is not itself a symptom.

QUESTION 2:

Which one of the following is a possible reason for the effort, time, and cost required to develop a program to increase exponentially with the size of the program while using the build and fix style of development?

- a. Programming languages lack suitable constructs required for the build and fix style of development
- b. Programmers lack competence in effectively using the build and fix style
- c. Programmers are able to use abstraction and decomposition techniques in a very limited way while using the build and fix model
- d. Programmers are able to make limited use of GO TO statements while using the build and fix model

Correct Answer: c. Programmers are able to use abstraction and decomposition techniques in a very limited way while using the build and fix model

Detailed Solution:

The build and fix model is an unstructured and ad hoc approach to software development, where the software is developed without any proper specification, design, or planning.

QUESTION 3:

A software development company is likely to face which one of the following difficulties, if it adopts the waterfall model in preference to the exploratory (build and fix) program development style in its development projects?

- a. Increased development cost
- b. Increased development time
- c. Decreased program maintainability
- d. Increased documentation overhead

Correct Answer: d. Increased documentation overhead

Detailed Solution:

The waterfall model is a plan-driven, sequential software development process consisting of phases like requirements, design, implementation, testing, and maintenance. One key characteristic of the waterfall model is its emphasis on thorough documentation at each stage before moving to the next.

QUESTION 4:

Which one among the following is not a software service type of project?

- a. Software maintenance
- b. Software customization
- c. Outsourced software development
- d. Software product development

Correct Answer: d. Software product development

Detailed Solution:

Software service type projects refer to projects where a company offers software-related services to a client, typically on a contract basis.

QUESTION 5:

Model building can be considered to be an application of which one of the following techniques?

- a. Abstraction
- b. Decomposition
- c. Aggregation
- d. Composition

Correct Answer: a. Abstraction

Detailed Solution:

Model building in software engineering involves creating a simplified representation of a complex system, focusing only on the relevant aspects while omitting unnecessary details. This is the essence of abstraction.

QUESTION 6:

Suppose you are getting an application software developed by a vendor for your organization. Which one of the following characteristics of the software delivered by the vendor to your organization is not a symptom of the present software crisis?

- a. Fails to meet user requirements.
- b. Expensive.
- c. Highly interactive
- d. Difficult to alter, debug, and enhance.

Correct Answer: c. Highly interactive

Detailed Solution:

Being highly interactive is a positive attribute of modern software, not a symptom of the crisis. In fact, interactivity typically improves user experience and is often a desired feature.

QUESTION 7:

A software process model represents which one of the following?

- a. The way in which software is developed
- b. The way in which software processes data
- c. The way in which software is used
- d. The way in which software may fail

Correct Answer: a. The way in which software is developed

Detailed Solution:

A software process model is a framework that describes the steps, activities, and tasks involved in developing software. It guides how a software project moves from requirements to design, implementation, testing, and maintenance.

QUESTION 8:

Which one of the following is not an important difference between the software development projects being undertaken now and the ones that were being undertaken several decades back?

- a. Project durations have shrunk from multi-years to few months now
- b. Project sizes have increased manifolds
- c. Use of high-level languages
- d. Increased code and design reuse

Correct Answer: c. Use of high-level languages

Detailed Solution:

"Use of high-level languages", is not a major differentiator between now and several decades back — hence, it is the correct answer.

QUESTION 9:

Which one of the following activities spans all stages of a software development life cycle (SDLC)?

- a. Coding
- b. Testing
- c. Project management
- d. Design

Correct Answer: c. Project management

Detailed Solution:

In the Software Development Life Cycle (SDLC), project management is the only activity that spans all stages — from requirement gathering, design, implementation, testing, to maintenance.

QUESTION 10:

Which one of the following is the most acceptable definition of a project?

- a. A series of activities designed to accomplish some objective
- b. An attempt to perform something that has well-defined objectives, and requires both human and other types of resources and usually has to abide by several constraints
- c. A coordinated effort to accomplish a well-defined goal but in general can be without any end points
- d. Any activity to which human and other resources must be allocated for it to proceed

Correct Answer: b. An attempt to perform something that has well-defined objectives, and requires both human and other types of resources and usually has to abide by several constraints

Detailed Solution:

A project, in professional and academic contexts (especially in project management and software engineering), is typically defined as:

- A temporary endeavor,
 - Undertaken to create a unique product, service, or result,
 - Having specific objectives,
 - Requiring resources (human, financial, technical, etc.),
 - Operated under constraints (time, cost, scope, quality).
-
